                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The nucleic acid encoding the chelon protein is useful for binding CC divalent mercuric ions, to take up, sequester and concentrate the heavy CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC immobilised onto a solid support, is useful for concentrating heavy metal contaminated environment waste streams or contaminated CC aqueous medium including biological fluids. The nucleic caid, when CC recombinantly expressed in enteric bacteria (which are nontoxigenic and CC nonpathogenic), is suitable for use in the in vivo sequestration and CC elimination of mercuric ion from gastrointestinal tracts of animals or CC molecules of the invention are also useful in water treatment resins. CC The nucleic acid of the invention is highly specific and binds divalent CC cacid represents the adjacent plasmid region that encodes the variant Merr cacid contain of the invention is highly specific and binds divalent CC acid represents the adjacent plasmid region that encodes the variant Merr contains of the invention.

cc producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector cc comprising a promoter active in the host cell operably linked to a coding cregion for the protein to produce a recombinant host cell and culturing cc region for the protein to produce a recombinant host cell under conditions, where DNA is expressed. Cc The nucleic acid encoding the chelon protein is useful for binding cc divalent mercuric ions, to take up, sequester and concentrate the heavy cc irrigation water of waste streams. The DNA of the invention, when cc inspection water of waste streams. The DNA of the invention or cc immobilised onto a solid support, is useful for concentrating heavy metal cc inspection water of waste streams. The nucleic acid, when cc recombinantly expressed in enteric bacteria (which are nontoxigenic and cc recombinantly expressed in enteric bacteria (which are nontoxigenic and cc molecules of the invention are also useful in water treatment resins. The nucleic acid of the invention are also useful in water treatment resins. The nucleic acid of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present nucleic acid of the singella flexneri wild-type Merk protein of the production of heavy metal binding proteins termed chelons.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of the haemolysin (hlyA) gene with two genes inserted into it, the cholera toxin subunit B gene (ctxB) and a mercury resistance gene (mer). It is used in the creation of a vibrio cholerae strain that has have 100% efficacy in protecting humans against subsequent infection with a strain of a similar serotype and avoid undesirable side effects such as diarrhoea, nausea and cramping. Cultures of these strains may be used for prodm. of vaccines against cholera. It is unclear whether the mer gene sequence is that of the sense or anti-sense straind as neither appears to have a clear reading frame. See also AAQ20185.

The new strains are derived from the 0139 serotype and the DNA encoding mercury resistance and the cholera toxin B subunit are necessary as a strains are immunogenic, inducing a strong local immunity and the mercury resistance gene allows the vaccine strain to be identified without the use of antibiotics. The new strains do

```

HIV; gag; packaging cell line; lentivirus; retroviral vector particle;

```
The patent discloses new packaging cell line for producing a viral cc accessory protein independent lentivirus, preferably cc human immunodeficiency virus (HTV), derived retroviral vector particles. The packaging cell line comprises a mammalian cell, a retroviral DNA cc comprising a coding sequence for a lentivirus, preferably HTV, gagpol, cc where the coding sequence has been mutagenised to improve expression of cc the viral gagpol proteins, a second retroviral nucleotide sequence comprising the coding sequence for a heterologous envelope protein and a cc third retroviral nucleotide sequence comprising a DNA sequence of cc interest and lentivirus, preferably HTV, cis-acting sequences required for packaging, reverse transcription and integration.

Cc The packaging cell lines and viral particles can be used for gene comprising the development with improved safety. They can also be used in the development and production of vaccines and biochemical reagents. The present sequence is a pol coding region of codon optimised HTV creating accounts and reduces the risk of recombination between the transfer company and reduces the risk of recombination between the transfer read-arms.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC accessory protein independent lentivirus, preferably
CC human immunodeficiency virus (HIV), derived retroviral vector particles.
CC The packaging cell line comprises a mammalian cell, a retroviral DNA
CC comprising a coding sequence for a lentivirus, preferably HIV, gagyol,
CC where the coding sequence has been mutagenised to improve expression of
CC the viral gagool proteins, a second retroviral nucleotide sequence
CC comprising the coding sequence for a heterologous envelope protein and a
CC third retroviral nucleotide sequence comprising a DNA sequence of
CC interest and lentivirus, preferably HIV, cis-acting sequences required
CC the packaging cell lines and viral particles can be used for gene
CC therapy or gene replacement with improved safety. They can also be used
CC the packaging cell lines and viral particles can be used for gene
CC therapy or gene replacement with improved safety. They can also be used
CC the production of that of a packaging construct phHMHgpm2 which
CC comprises a codon optimised HIV gagool. The plasmid is defective for the
CC production of the viral envelope and accessory proteins e.g. tat, vif,
CC vpr, rev and Rev response element (RRE). It also lacks the viral
CC sequences which are transcribed into mRNA, e.g. constitutive transport
CC cell line.

The nucleic acid molecule and its encoded protein (modified HIV Env. Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.

The nucleic acid molecule and its encoded protein (modified HIV ENV, Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic Tlymphocyte (CTL) response against native HIV Env, Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (CHAD/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env, Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env, Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or NESU1449-ABK91624 represent modified HIV protein-encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New modified human immunodeficiency virus Env, Gag, Pol of Nef DNA and its encoded protein, useful as vaccines for genetic or protein immunisation for acquired immunodeficiency syndrome or human immunodeficiency virus infection -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14-AUG-2001; 2001WO-US25721
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WO200232943-A2

                                                         Modified HIV protein-encoding plasmid DNA #166.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env, Gag, Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTI) response against native HIV Env, Gag, Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or LTDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.
                                                                                                    14 - AUG - 2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env. Gag. Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag. Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 9170 BP; 2225 A; 2669 C; 2519 G; 1757 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            plasmid DNA sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid molecule encoding a modified HIV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a nucleic acid molecule encoding a modified HIV (human immunodeficiency virus) protein. The nucleic acid molecule and its encoded protein (modified HIV Env. Gag. Pol or Nef) are useful for genetic or protein immunisation to a host, respectively. In particular these are useful for ameliorating the symptoms of acquired immunodeficiency syndrome (AIDS) or HIV infection and generating an antibody or cytotoxic T lymphocyte (CTL) response against native HIV Env. Gag. Pol or Nef. Furthermore, the nucleic acids, proteins and subsequent compositions are useful for treating or preventing HIV infections or AIDS. Sequences ABK91449-ABK91624 represent modified HIV protein-encoding plasmid DNA sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-AUG-2000; 2000US-225097P.

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP). http://www.edgp.ebi.ac.uk...This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector Drosophila melanogaster.

- Partially Hind III digested and size-selected S. mansoni cercarial DNA was ligated into Hind III digested pBeloBAC II vector and used to transform E. coll DH10B. The complete library contains 23808 clones from 4 independent sizing-ligation-transformations. Average insert size ranges from 70-127 kb and genome coverage is 7.9-fold.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CNS07L8T 736 bp DNA linear GSS 08-OCT-200 T3 end of clone 013CB03 of library SmBAC1 from strain Puerto-Rican

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note="Vector: lambdaZAP; Site_1: EcoR1; Site_2: Xho1; Plants were grown in the greenhouse at the University of California, Riverside (Fenton, SJ Close, TJ Close). Whole spikes with awns trimmed were collected at 5, 10, 15, 20, 30 and 45 DAP (Fenton). Total RNA was prepared from each pool, equal quantities of all six RNA pools were combined, unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Choi)in the TJ Close lab at the University of California, Riverside. Phagemids were plated and picked at the Clemson Prisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Prisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence above. For more details on library preparation and sequence analysis see of phred value 20 or sequence analysis see.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence analysis see

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       xhoI; This library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites. PBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   chauser@duke.edu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /organism-"Chlamydomonas reinhardtii"

QΥ
                                                                                                                                      The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC sequence and an oligonucleotide comprising a sequence complementary to the CC sequence and an oligonucleotide comprises a 3'-end sequence, where the CC oligonucleotide which comprises a 3'-end sequence, where the CC oligonucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises a 3'-end sequence, where the CC the 5'-end sequence/3'-end sequence is selected from those defined in CC in gene therapy. The primers sets can be used in antisense therapy and comparticularly full-length cDNAs. The primers are useful for synthesising polynucleotides, and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB1563 to AAH13674 represent human cDNA sequences; and AAH13629 to AAH13620 of the present luman amino acid sequences; and AAH13629 to AAH13632 of the present human canno acid sequences; and AAH13629 to AAH13632 of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ARK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM62170 to AAM91921. (I) have cytostatic c activity, and can be used in gene therapy and vaccine production. (I) createns and polynucleotides may be used in the prevention, diagnosis and c treatment of diseases associated with inappropriate (I) expression. For c example, they may be used to treat disorders associated with decreased c expression by rectifying mutations or deletions in a patient's genome ct that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) c polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the c protein. (I) proteins and polynucleotides may be used to prevent, c diagnose and treat immune/haematopoietic-related diseases, especially c ancers and cancer metastases of haematopoietic derived cells. ARK64703 c sequences from the present invention. ARK64942 to ARK84950 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cy which binds mercuric ions. The invention is useful for recombinantly comprising a protein in a host cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing companies. The nucleic acid encoding the chelon protein is useful for binding crimtopic contaminated soil, ground water, hydroponic solutions or crimtopic ions from contaminated soil, ground water, hydroponic solutions or constraint environment waste streams. The DNA of the invention, when conspication water of waste streams. The DNA of the invention and concentrated environment waste streams or contaminated concentrating heavy metal constraints and concentrating heavy metal constraints are contaminated environment waste streams or contaminated concentration and concentration of mercuric ion from gastrointestinal tracts of animals or elimination of mercuric ion from gastrointestinal tracts of animals or concentration and concentrate and concentration an
                                                                                                                                                                                                                                                                                                                                                     В

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new non-naturally occurring crecombinant DNA molecule comprising a sequence encoding a chelon protein comprising a protein in a host-cell, by infecting or recombinantly created in a host-cell by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding cell into strom contaminated soil, ground water, hydroponic solutions or immobilised onto a solid support, is useful for concentrate the heavy constitued in the contaminated contaminated contaminated environment waste streams or contaminated conspathogenic), is suitable for use in the in vivo sequestration and compathogenic), is suitable for use in the in vivo sequestration and contamination of mercuric ion from gastrointestinal tracts of animals or humans expressed to tryin marks increased environtestinal tracts of animals or contaminated contamination of mercuric ion from gastrointestinal tracts of animals or contaminated contamination of mercuric ion from gastrointestinal tracts of animals or contaminated contamination of mercuric ion from gastrointestinal tracts of animals or contaminated contamination of mercuric ion from gastrointestinal tracts of animals or contaminated contaminated contaminated contaminated contaminated contaminated contamination and contaminated contamination or marks in the in vivo sequestration and contaminated contamination contaminated 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                humans exposed to toxic metal ions such as mercury and/or cadmium. The molecules of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present nucleic acid sequence represents synthetic product 2 forward PCR primer that was used in the methods of the invention for construction of pASK-MBD vector.

Synthetic product 2 forward PCR primer for construction of pASK-MBD

```
Mercuric ion; contaminated soil; ground water; hydroponic solution; irrigation water; waste stream; contaminated aqueous medium; biological fluid; gastrointestinal tract; chelon protein; enteric bacteria; toxic metal ion; mercury; cadmium; divalent cation; heavy metal binding protein; pASK-MBD; PCR; primer; ss.
                                           metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when immobilised onto a solid support, is useful for concentrating heavy metal ions from contaminated environment waste streams or contaminated on seedium including biological fluids. The nucleic acid, when aqueous medium including biological fluids. The nucleic acid, when recombinantly expressed in enteric bacteria (which are nontoxigenic and nonpathogenic), is suitable for use in the in vivo sequestration and elimination of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The nucleic acid of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present nucleic acid sequence represents synthetic product 1 reverse PCR primer that was used in the methods of the invention for construction of pask-MBD vector.
                                                                                                                                                                                                                                                                                                                                                                                                        recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding divalent mercuric ions, to take up, sequester and concentrate the heavy divalent mercuric ions, to take up, sequester and concentrate the heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel non-naturally occurring recombinant DNA molecule encoding a chelon protein useful for binding divalent cation mercury from contaminated soil, water, aqueous medium including biological fluids -

                                                                                                                                                                                                                                                                                                                                                                                                                    cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding term for the protein to produce a recombinant host cell under conditions, where DNA is expressed. CC the recombinant host cell under conditions, where DNA is expressed. CC divalent mercuric ions, to take up, sequester and concentrate the heavy cell integration water of waste streams. The DNA of the invention, when cell intrigation water of waste streams. The DNA of the invention, when cell cans from contaminated environment waste streams or contaminated environment waste streams or contaminated environment waste streams or contaminated cell intrigation of mercuric ion from gastrointestinal tracts of animals or nonpathogenic), is suitable for use in the in vivo sequestration and cell call of the invention are also useful in water treatment resins. CC molecules of the invention are also useful in water treatment resins. CC acido such as mercury or cadmium with high affinity. The present nucleic acid sequence encodes the Shigella flexneri wild-type Merk protein of the invention. This sequence was used in the methods of the invention for the protein of the invention of the methods of the invention for the protein of the invention of the methods of the invention for the protein of the invention of heavy metal binding proteins termed chelons.

It is used in the creation of a Vibrio cholerae strain that has have 100% efficacy in protecting humans against subsequent infection with a strain of a similar serotype and avoid undesirable side effects such as diarrhoea, nausea and cramping. Cultures of these strains may be used for prodn. of vaccines against cholera. It is unclear whether the mer gene sequence is that of the sense or anti-sense strand as neither appears to have a clear reading frame. See also AAQ20185.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABK52213 standard; DNA; 509 BP.
The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                           18-APR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO200230962-A2.
                                                                                                                                                                                     Novel non-naturally occurring recombinant DNA molecule encoding a chelon protein useful for binding divalent cation mercury from contaminated soil, water, aqueous medium including biological fluids

CC The nucleic acid encoding the chelon protein is useful for binding CC divalent mercuric ions, to take up, sequester and concentrate the heavy CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC immobilised onto a solid support, is useful for concentrating heavy metal CC cons from contaminated environment waste streams or contaminated CC recombinantly expressed in enteric bacteria (which are nontoxigenic and CC nonpathogenic), is suitable for use in the in vivo sequestration and CC elimination of mercuric ion from gastrointestinal tracts of animals or CC humans exposed to toxic metal ions such as mercury and/or cadmium. The nucleic acid of the invention are also useful in water treatment resins. CC molecules of the invention are also useful in water treatment resins. CC cation such as mercury or cadmium with highly specific and binds divalent CC acid represents the adjacent plasmid region that encodes the variant Merr CC protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                     ABK52206

CC producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed.

CC The nucleic acid encoding the chelon protein is useful for binding cometal ions from contaminated soil, ground water, hydroponic solutions or immobilised onto a solid support, is useful for concentrate the heavy compatible of the invention water of waste streams. The DNA of the invention, when concentrating heavy metal ions from contaminated environment waste streams or contaminated concentrating heavy metal constrainment is useful for concentrating heavy metal constrainment protein and concentrating heavy metal constrainment waste streams or contaminated concentration and concentration of mercuric ion from gastrointestinal tracts of animals or molecules of the invention are also useful in water treatment resists. Concentration acid of the invention is highly specific and binds divalent acid sequence encodes the synthetic Merr chelon variant protein of the concentration of the invention. This sequence encodes one of the heavy metal binding proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches 321;

cc recombinant DNA molecule comprising a sequence encoding a chelon protein combinant DNA molecule comprising a sequence encoding a chelon protein combinantly protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell operably linked to a coding the recombinant host cell under conditions, where DNA is expressed. Cc divalent mercuric ions, to take up, sequester and concentrate the heavy irrigation water of waste streams. The DNA of the invention, when climated into a solid support, is useful for concentrating heavy metal consistent mercuric ions from contaminated environment waste streams or contaminated conto a solid support, is useful for concentrating heavy metal aqueous medium including biological fluids. The nucleic acid, when conspathogenic), is suitable for use in the in vivo sequestration and climatation of mercuric ion from gastrointestinal tracts of animals or conteminant of the invention are also useful in water treatment resins. The nucleic acid of the invention as mercury and/or cadmium. The contents exposed to toxic metal ions such as mercury and/or cadmium. The cation such as mercury or cadmium with high affinity. The present nucleic acid sequence represents the bASK-MBD gene. as described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABK52212

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                               Score

                                                                                                                                                                                                                                                                                                                              1 (bases 1 to 3763)
Barrineau, P., Gilbert, P., Jackson, W.J., Jones, C.S., Summers, A.O. and Wisdom, S.
provided by A.O. Summers, 15-SEP-1986. Potential Shine-Dalgarno provided by A.O. Summers, 15-SEP-1986. Potential Shine-Dalgarno sequences are located at positions 157-162 (13.1 kd), 590-596 (12.4 kd), 1740-1745 (59 kd) and 545-542 (15.9 kd). A single 38 bp inverted repeat, which delimits the leftward end of Tn21, Tn4 and Tn501 extends from nucleotide 65-102. A promoter region for the structural genes is located between positions 366-585. This area contains regions of dyad symmetry which might function as operator sites for merk, which negatively regulates the expression of the structural genes as well as its own expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The proteins deduced from the open reading frames all have counterparts in other organisms. The 12.4 kd and 15.0 kd predicted peptides are located in the inner membrane and have no detectable precursors. The 9.4 kd peptide is soluble, is processed to a 12 kd form and is for the most part associated with the periplasm. The first 30 bases were replaced with the corrected sequence from [2]. The rest of the revisions are in the sites table.
